

Actual Outside Diameter of Pipe Threads

What you measure with a ruler is NOT the correct pipe thread you need to specify for your replacement valve. As you can see in this reference chart by Sloan there is a difference.

The diameters of the circles on this page do not match the labels on the circles. Industry sizes are SMALLER than any measurements by ruler. For example: 3/8 NPT measures more than 5/8" across!

To find the thread size of a valve you have removed from your truck you can measure the diameter but you must then find the circle here that has the same diameter. The label on the circle is the thread size to ask for.
